SHEDS-Dietary Technical Manual Appendices

APPENDIX A. BACKGROUND INFORMATION ON THE FOOD AND WATER CONSUMPTION DATAUSED IN SHEDS DIETARY

Table A-1: An Example CSFII Food Diary (CSFII ID=28517-2-2: 1 yr, M, 13.6 kg)

SEQN	Time of Day	Food Description	Amount (unit code)	Consumption (gm)	Food Source /1
1	7:00 AM	Milk, cow's, fluid, whole	6 fl.oz (10205)	183	Store
2	10:15 AM	Egg, whole, fried W/ LARD	2 XX (60919)	92	Store
3		White potato, home fries W/ LARD	2 C (10205)	388	Store
4	6:00 PM	Chicken, drumstick, with or without bone, roasted, skin eaten	1 XX (61343)	52	Store
5		White potato, home fries W/ LARD	2 C (10205)	388	Store
6	8:00 PM	Milk, cow's, fluid, whole	6 fl.oz (10205)	183	Store

/1 The Food Source variable is based on the question, 'Where was the food item obtained?' (1=store, etc.).

Table A-1 presents a food diary for CSFII diary, 28517-2-2: day '2' intake for a 1 year old male, weighing 13.6 kg. This individual reportedly consumed 6 fluid ounces (183 grams) of milk at 7:00 am, 2 servings (92 grams) of 'Egg, whole, fried w/Lard' and 2 cups (288 grams) of 'white potato, home fries w/Lard' at 10:15 am, one serving (52 grams) of 'Chicken drumstick' and 2 more cups (288 grams) of 'home fries' at 6:00 pm, and 6 fluid ounces (183 grams) of milk at 8:00 pm.[1] [4] This particular child's Day 1 intake did not include 'home fries', but did include the following: 183 grams of whole milk at 3:00 am, 80 grams of eggs at 9:00 am, 280 grams of spaghetti and 180 grams of Fruit drink at 5:00 pm, and 183 grams of whole milk at 9:00 pm.

Water may be consumed either **directly** or **indirectly** through consumption from foods (e.g., infant formula, 'kool aid', coffee, tea, etc.). Total drinking water intake can also be decomposed by primary source (tap, bottled, other, miscellaneous).[2] Table A-2 presents the average drinking water intake, by age group and source. This table indicates that adults (20+ yrs old) tend to consume a greater (absolute) amount of water (~1500 mL/day) than children, but infants have the highest drinking water intake per kilogram bodyweight (65.4 mL/kg bwt/day).

Table A-2: Mean Per Capita Intake of Drinking Water, by Age Group and Source

---

[2] The SAIC report details the method for assigning direct and indirect drinking water, by source. Indirect 'water' does not include consumption of 'water' in manufactured Beverages (e.g., soda pop, beer, etc.), or water content of foods (e.g., watermelon). Similarly, milk-water also is not indirect drinking water. There was no indirect drinking water intake in the food diary presented above (CSFII ID=28517-2-2). The SAIC report is available in the US EPA (2000) FCID CD ROM, most recent version, 3-8-2004.

The CSFII-FCID data also indicates that there is a considerable amount of variation in drinking water intake within any age group. Figures A-3a to A-3c present three different scatter plots of drinking water consumption, for infants, children ages 1-2 yrs old, and adults 20-49 yrs old, respectively. These plots present 3 values for each food diary: (1) total water consumption (black dot), (2) total direct water consumption (pink dot), and (3) total indirect water consumption (yellow dot). Figure 1a illustrates that infants generally obtain most of their total intake from indirect drinking water (yellow). An inspection of the data reveals that most of this indirect water consumption is through infant formula. For children 1-2 yrs old, direct drinking water (pink) becomes relatively more significant to total water intake. For adults ages 20-49 yrs old, direct drinking water (pink) is the primary source of total daily intake for most individuals. In all cases, there are some exceptions to this general observation. A review of the CSFII data will indicate that some 1-2 yr olds consume large amounts of indirect water ('kool-aid kids'), as do a number of adults ('coffee club').
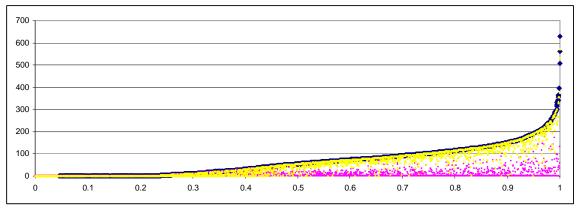

Figure A-3a: Drinking Water Intake, By Source (Total, Direct, Indirect): All Infants (N=2970)

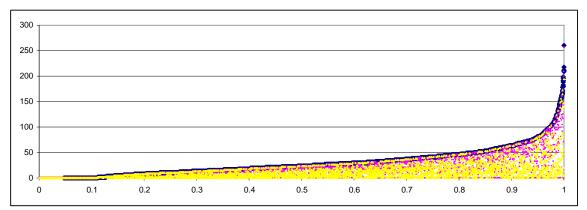

Figure A-3b: Drinking Water Intake, By Source (Total, Direct, Indirect) Children 1-2 yrs old (N=4192)

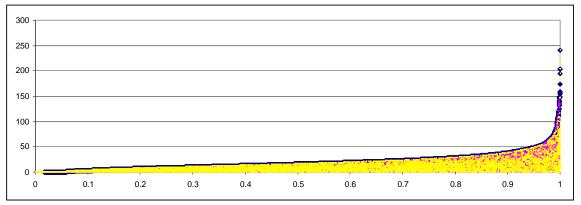

Figure A-3c: Drinking Water Intake, By Source (Total, Direct, Indirect): Adults 20-49 yrs old (N=9354)

Timing and Amounts of Direct Drinking Water Intake

As indicated above, the CSFII food diaries contain information on the time of day and corresponding amounts of indirect drinking water (e.g., infant formula, soups, coffee/tea, etc.). Therefore, this data supports the ability to conduct an eating occasion analyses of **indirect** drinking water consumption. For direct drinking water exposures, the CSFII simply asked the question: "*How many fluid ounces of plain drinking water did you consume yesterday?*" The

respondents provided an estimate of their total direct drinking water intake, but were not asked to estimate when and how much water was consumed throughout the day.

APPENDIX B. BACKGROUND INFORMATION ON THE WATER CONCENTRATION DATA USED IN SHEDS-DIETARY

Table B-1 presents the format in which predicted drinking water concentration data are provided to the dietary risk assessors. The duration of the modeling period (30 years) is based on the availability of meteorological data for a particular location. For example, rainfall (and other meteorological) data from January 1st, 1960 through December 31st, 1990 may be available for a particular site in the Midwest. The environmental fate models predict drinking water concentrations based on that rainfall data; as well as other inputs (e.g., half-lives, soil types, and pesticide use - application method, rates and timing, etc.).

Table B-1: Array of Predicted Drinking Water Concentrations (ppb)

Location	Use (site)	Year	1-Jan	2-Jan	3-Jan	- - - -	30-Dec	31-Dec
Midwest-1	Corn	1960	xx	xx	xx	- - - -	xx	xx
Midwest	Corn	1961	xx	xx	xx	- - - -	xx	xx
Midwest	Corn	1962	xx	xx	xx	- - - -	xx	xx
‖	‖	‖	‖	‖	‖	- - - - -	‖	‖
Midwest	Corn	1989	xx	xx	xx	- - - -	xx	xx
Midwest	Corn	1990	xx	xx	xx	- - - -	xx	xx

Note two practices in the Agency's drinking water risk assessments: First, all (**total**) drinking water consumed (this includes both direct and indirect consumption, from all sources, tap, bottled, other and/or miscellaneous) are assumed to contain the same concentration level – i.e., only one concentration value is selected in the Monte-Carlo simulation. While the models may have the option of allowing different sources to have different concentrations, those options are **not used** in an Agency drinking water risk assessment. Second, indirect drinking water concentrations for any food (e.g., infant formula, coffee, tea, etc.) are **not** refined with any cooking processing factor. Again, while the aggregate exposure models may provide users with the option of making such refinements, the Agency has **not** utilized those options in its dietary risk assessments. Given these two practices, drinking water is conceptually similar to any other food consumed: one residue value is randomly selected and multiplied by total daily intake, or by intake at various occasions throughout the day.

APPENDIX E. CSFII FOOD DEFINITIONS

Table E-1 presents the FCID recipes for the four distinct food items consumed by the CSFII diary described above. Whole milk is decomposed into fat (3.3%), non-fat solids (8.7%) and milk-water (88%). This composition varies by type of milk (e.g., 1% milk has 1.06% fat), and across other diary products (e.g., 'Cheese, processed, American and Swiss blends' has 31% fat, 24% non-fat solids, and 38% milk-water). The cooking method and food forms are also listed for each commodity. Food forms may vary across the ingredient commodities, e.g., a cheeseburger may have uncooked lettuce (FF=110), and cooked beef (FF=213). Table E-2 presents the coding for the FCID food forms. By convention, 'food form' refers to three fields: 'Cooking Status', 'Food Form' and 'Cooking Method', concatenated in that order. Therefore, food form=110 refers to a fresh, uncooked commodity, such as an 'apple', 'banana', or the fresh 'lettuce' on a cheeseburger.

Table E-1: FCID Recipes for Selected Foods

Ingre dient	RAC Code	Commodity (RAC)	Cooking Status	Food Form	Cooking Method	Pct
Milk, cow's, fluid, whole (11111000)						
1	27002220	Milk, fat	1	1	0	3.3
2	27012230	Milk, nonfat solids	1	1	0	8.7
3	27022240	Milk, water	1	1	0	88
Egg, whole, fried with Lard (31105000-100774)						
1	25002930	Pork, fat	2	1	3	4.6
2	70001450	Egg, whole	2	1	3	109
White potato, home fries with Lard (71403000-200001)						
1	1032990	Potato, tuber, w/peel	2	1	3	82.6
2	3002370	Onion, dry bulb	2	1	3	10.6
3	19022740	Pepper, black and white	2	1	3	0.034
4	25002930	Pork, fat	2	1	3	6.8
Chicken, drumstick, with or without bone, roasted, skin eaten (24142210)						
1	40000930	Chicken, meat	2	1	1	78.8
2	40000960	Chicken, fat	2	1	1	11.2
3	40000970	Chicken, skin	2	1	1	10.1

The FCID recipes are important for regulatory decisions since food tolerances are set on raw agricultural commodities. While its nice to know that a typical 'cheeseburger' may contain a certain amount of pesticide residues, the Agency needs to know the expected contributions from beef, lettuce, fresh tomatoes, wheat, etc., to determine exposures from the corresponding agricultural uses (food, feed, livestock, etc.). The FCID **food forms** are also important since the anticipated residues may be refined based on processing studies (e.g., tomato soup may have different residues than fresh tomatoes due to cooking).

Table E-2: Coding for FCID Food Forms

Cooking Status (CS)		Food Form (FF)		Cooking Method (CM)	
Code	Description	Code	Description	Code	Description
1	Uncooked	1	Fresh or N/S	0	Not specified
2	Cooked	2	Frozen	1	Baked

3	Dried	2	Boiled
4	Canned	3	Fried
5	Cured, pickled, smoked, salted	4	Fried or baked
6	Not Applicable	5	Boiled or baked
Following FCID convention, 'Food Form' refers to the concatenation of the three fields: CS-FF-CM; or: Apples (raw) has FF='110'=Uncooked/Fresh/Not specified.			

Table E-3 presents the **total** daily consumption, by commodity (RAC-FF) for the CSFII diary presented in Table 1. These values reflect consumption over all eating occasions, by commodity based on the FCID recipes. Detailed information on the time of day and corresponding amounts consumed are not included in these diaries. The dietary exposure models currently utilize these 'RAC-FF' diaries since it quickens the calculation of 'total daily' exposures used in the Agency's acute dietary risk assessments.

Table E-3: Example Total Daily (RAC-FF) Diary (CSFII ID=28517-2-2: 1 yr, M, 13.6 kg)

Table E-4 presents the consumption data for the same diary as in Table E-3 but with consumption listed by eating occasion. These data may be used for an eating occasion analyses since they retained the information on the time and amounts of foods (commodities) consumed throughout the 24 hour period.

APPENDIX F. DIRECTORIES, LIBRARIES, AND FILES

All of the directories that SHEDS-Dietary uses are placed underneath the installation directory, which is chosen by the user at install time. By default this is in the user's My Documents/SHEDSDietary (or similar) directory. The install directory will be referred to as the install directory or <install> in the following discussion and diagrams.

Directories/Libraries

On installation, the directories are laid out as in Table 0-. The indentation of a directory name implies that it is within the directory above it. Each of these directories is also assigned to a SAS library. Default and example SHEDS-Dietary input files can be found in the libraries highlighted in green. The libraries highlighted in blue are the default locations for SHEDS output files. The yellow libraries are those containing model input data that should not be edited by the user. The pink libraries contain model code.

Table 0-2. SHEDS-Dietary Directories and Libraries

Directory	SAS Library	Description
<install>/d_interface/Diet_all	diet_all	Contains all the raw dietary data . This includes Food Diaries, Demographics, ADD FCID Recipes and LOOKUP tables: e.g. commodity names, name of eating occasion, food sources.
<install>/d_interface /Output	output	Default directory for cross-sectional output
<install>/d_interface /Output/detail	Odetail	Default directory for detailed output
<install>/d_interface /Output/long	Olong	Default directory for longitudinal output
<install>/d_interface /Output/sumtab	sumtab	Default directory for summary output
<install>/d_interface /User	Usr	Contains the dietary model code
<install>/d_interface /Macro	Macro	Not currently used

Input Files

This Appendix provides data on the format and contents of the SHEDS-Dietary Input files. This information can be used as guidance for creating such files for different types of runs. Information about the format of food residue distribution files (RDF files) and single chemical Bridge Files are provided in the main body of the manual, as these files can be edited directly within the interface.

The Run Information File

The Run Information File is the main file that controls the SHEDS-Dietary simulation. The contents of the file are given in Table 0-.

Table 0-3. Variables in the Run Information File

Variable	Description
ResidueDir	Residue file location (relative to Dietary root)
ByWeight	Risk factors are normalized by weight in kg (Yes/No) (Not currently used)
UsePAD	Use population adjusted dose (Yes/No) (Not currently used)
BySeason	Not currently used
ShwDaily	Add daily totals to output (Yes/No)
ShwDetails	Add details to output (Yes/No) (Not currently used)
ShwEating	Add eating occasions to output (Yes/No)
chronicPAD	Chronic population adjusted dose (Not currently used)
chronicPADF	Chronic population adjusted dose – females (Not currently used, could be used to enter unique data for females)
acutePAD	Acute population adjusted dose (Not currently used)

rr_label	Label for pre-processing

Final (Processed) Residue Files for Single Chemicals

Recall that SHEDS-Dietary can use either individual food residue distribution files (RDF files) or a final processed residue file. The format of the food residue files is discussed in Section **Error! Reference source not found.**. This section describes how a final residue file may be constructed. Like food residue files, final residue files are also used in conjunction with the single-chemical Bridge File discussed in Section **Error! Reference source not found.**. The index set in the Bridge File refers to a record in the final residue file. In this way, the EDFs are linked to the food commodities listed in the Bridge File.

A final residue file is a SAS dataset containing multiple rows, where each row contains data for a single studied food item, and is given an index. All units must be ppm. Each row also contains a comma-separated list of residue values that are assigned to the food commodities listed in the Bridge File via the index. The variables required in the Residue file are given in Table 0-4, and an example final residue file is shown in Figure 0-1.

Table 0-4. Variables in the Final Residue File for Single Chemicals

Variable	SAS Format	Description
Index_num	Numeric	Integer index for the food in question; used to link to the Bridge File: corresponds to Bridge File variable rdl_1 (File Index 1).
resid_n	Numeric	Number of non-zero residue measurements
total_zero	Numeric	Number of zero residue measurements
all_residue	Character (20000 max)	A comma-separated list of all non-zero residue values.

Final (Processed) Residue Files for Multiple Chemicals

The multichemical residue file provides a database of residue measurements for a number of related chemicals. A multichemical residue file for pyrethroids is provided with SHEDS-Dietary. These residue files can be created in SAS or generated within SHEDS-Dietary via the PDP Generator. The required variables in the file are given in Table 0-. An example is shown in Figure A-2 .

The file has a relatively simple structure. On each observation, the studied food commodity and type are listed along with the year of sample and the measured values for each of N chemicals. All units must be in ppm. Each row of the file lists one residue measurement for each chemical for the studied food commodity and type pair listed. The residue measurements will be linked to standard food commodities listed in the Bridge File via the IDs of the commodity-type pair.

Table 0-5. Variables in the Final Residue File for Multiple Chemicals

Variable	SAS Format	Description
Commod	Char	Studied commodity code
Commtype	Char	Studied commodity type
Year	Numeric	Year of sample
Sample_pk	Numeric	
Ppm_XXX	Numeric	Residue concentration in ppm for chemical code XXX (There may be many chemicals in each file, and thus many ppm_XXX variables).

Figure 0-2. A Final Residue File for Multiple Chemicals (Pyrethroids).

The assignments of chemical names to chemical codes must be provided in the b_pestcode input file contained in the m_pest library. This file contains a list of chemical codes and their corresponding names; is shown below in Table 0- and Figure A-3. If the user is going to run their own chemicals they would need to add the codes and names they are going to use to this file.

Bridge Files for Multiple Chemicals

The form of the Bridge File for multiple chemicals is different than that for single chemicals, it serves an analogous purpose: to assign the residue measurements present in the multi-chemical residue file to food commodity IDs. Like the single chemical Bridge File, the multi-chemical file contains a single of food commodity, form, and type on each row. Each of these commodities is then assigned one or more of the commodity-type pairs for which measurements are present in the residue file. The variables present in the file are given in Table 0-7; and example is shown in Figure A-5.

Table 0-7. Variables in the Bridge File for Multiple Chemicals

Variable	SAS Format	Description
Com_ff	Character	Commodity food form
Commod_Code	Character	Commodity code
Commtype	Character	Commodity type
ZZ_Code	Character	List of commodity codes from residue file (commod in that file). ZZ_code and ZZ_Type together define commodity-type pairs to assign to this food form
ZZ_Type	Character	Corresponding list of commodity types from residue file (commtype in that file). ZZ_code and ZZ_Type together define commodity-type pairs to assign to this food form

Figure 0-4. Example Bridge File for Multiple Chemicals

Processing Factor Files (Multiple Chemicals)

These files are required for multichemical runs. They include processing factors that can be used to adjust residue values based on the anticipated change in residue concentration during the processing of raw food. Processing Factor files can be created in SAS or generated within SHEDS-Dietary via the PDP Generator. The contents of this file are given in Table A-7. An example Processing Factor File is shown in Figure A-5.

Chemical Code Files (Multiple Chemicals)

Chemical code files contain a list of chemicals that can be run in a multichemical simulation. The information that is included in this file is given in Table A-8. An example chemical code file is shown in Figure A-6. Chemical code files can be created in SAS or generated within SHEDS-Dietary via the PDP Generator.

Output Files

By default, all output files from the SHEDS-Dietary run are stored in <install>/Output. Cross-sectional output is stored in the main Output library, longitudinal datasets are stored in the Olong library, and summary datasets are stored in Sumtab. However, note that the interface allows the user to choose libraries other than these for writing output.

The general structures of different types of SHEDS-Dietary outputs are provided here.

Cross-Sectional Output Datasets

By default, output from a cross-sectional SHEDS-Dietary run is written to the Output library. These files will begin with the cross-sectional prefix assigned by the user for the run, and food exposure files will end with a suffix "_X" where X is the loop number. Water exposure output

files will have an analogous suffix "_X_w". The contents of the cross-sectional files are given in Table 0-.

Table 0-10. Variables in the Cross-Sectional Output Datasets

Variable	Format	Description
HHID	Numeric	
SPNUM	Numeric	
Daycode	Numeric	
AGE	Numeric	Age in years (food consumption diary)
SEX	Numeric	Sex
WGT_KG	Numeric	Weight in kilograms
WT4_2DAY	Numeric	Statistical weight
tot_cal	Numeric	Total calories consumed
age_group	Character	Age-group simulated
ARFD	Numeric	Acute reference dose
OCC_TIME	Numeric	Time of eating occasion
comcode (FCID code)	Numeric	EPA commodity code
Ff	Numeric	food form
com_gram	Numeric	grams of chemical consumed
exp_ug (single chemicals)	Numeric	Exposure in micrograms
exp_ug (multiple chemicals)	Numeric	Total exposure in micrograms
ug_XXX (multiple chemicals)	Numeric	Exposure in micrograms for chemical code XXX

Longitudinal Output Datasets

By default, output from a cross-sectional SHEDS-Dietary run is written to the Olong library. These files will begin with the longitudinal dataset name assigned by the user for the run; water exposure files will end with a suffix "_w".

The contents of the longitudinal files are given in Table 0-1.

Table 0-11. Variables in the Longitudinal Output Datasets

Variable	Format	Description
person_id	Numeric	Person ID
date	Numeric	Date
id	Numeric	Diary ID
loop	Numeric	Loop number for this day
diary_age	Numeric	Age on food diary
age_group	Numeric	Age group
total_cal	Numeric	Total calories consumed
weight	Character	Statistical weight
aRFD	Numeric	Acute reference dose
exp_ug (single chemicals)	Numeric	Exposure in micrograms
exp_ug (multiple chemicals)	Numeric	Total exposure in ug for chemical code XXX
ug_XXX (multiple chemicals)	Numeric	Exposure in ug for chemical code XXX

Summary Output Datasets

The summary output datasets are generated by the Pre-Process Output data screen, and by default written to the Sumtab library. The results are generated for one variable at a time using the Pre-process frame, for either exposure to single chemical, or total exposure (for multi-chemical runs). These files will begin with the prefix assigned by the user when the data is preprocessed. These are the data that can be visualized with the View Cross-Sectional Results screen. The files and their contents are as follows:

PREFIX_contrib: Contribution by commodity to exposure and food consumed**.**

PREFIX_pctl_day: Percentiles for daily exposure: food (dietary), water and total.

PREFIX_ pctl_occ: Percentiles for eating occasion exposure: food (dietary), water and total**.**

PREFIX_ summary_day: Summary percentiles for daily exposure by age group**:** food (dietary), water and total.

PREFIX_ summary _occ: Summary percentiles for eating occasion exposure by age group**:** food (dietary), water and total.

PREFIX_ tab_day: Daily exposure and percent %APAD percentiles by age group: food (dietary), water and total.

PREFIX_ tab _occ: Eating occasion exposure and percent %APAD percentiles by age group: food (dietary), water and total.
